

Hash Functions

Data Integrity and Source Authentication

- Encryption does not protect data from modification by another party.
- Need a way to ensure that data arrives at destination in its original form as sent by the sender and it is coming from an authenticated source.

Hash Function

- The hash value represents concisely the longer message
 - may called the *message digest*
- A message digest is as a ``digital fingerprint'' of the original document

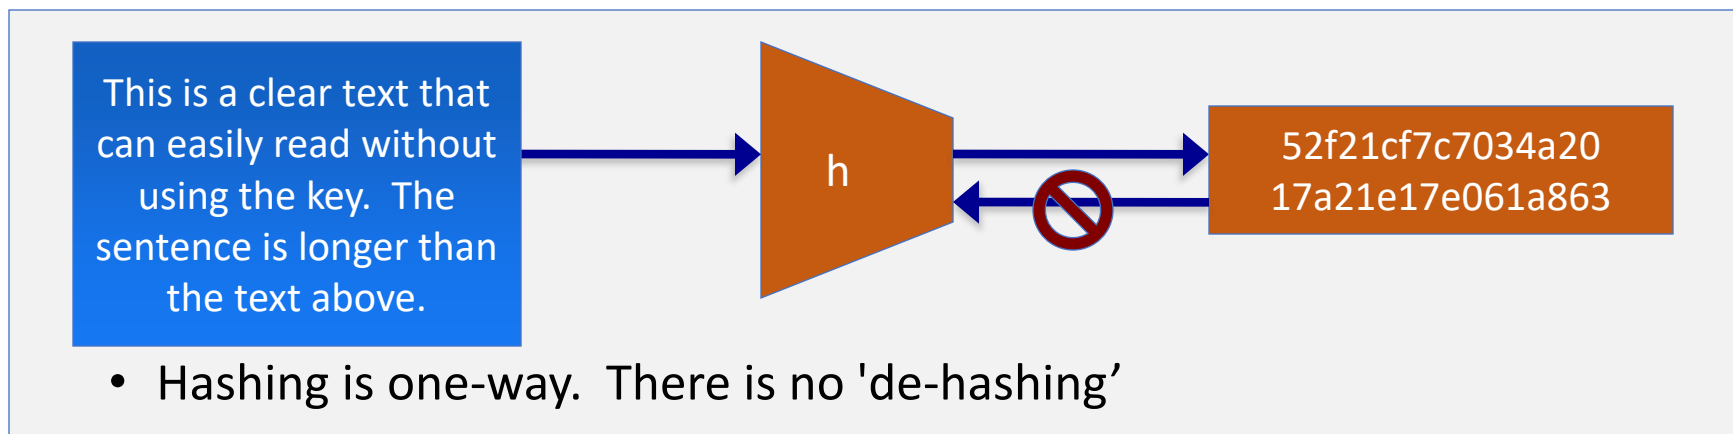

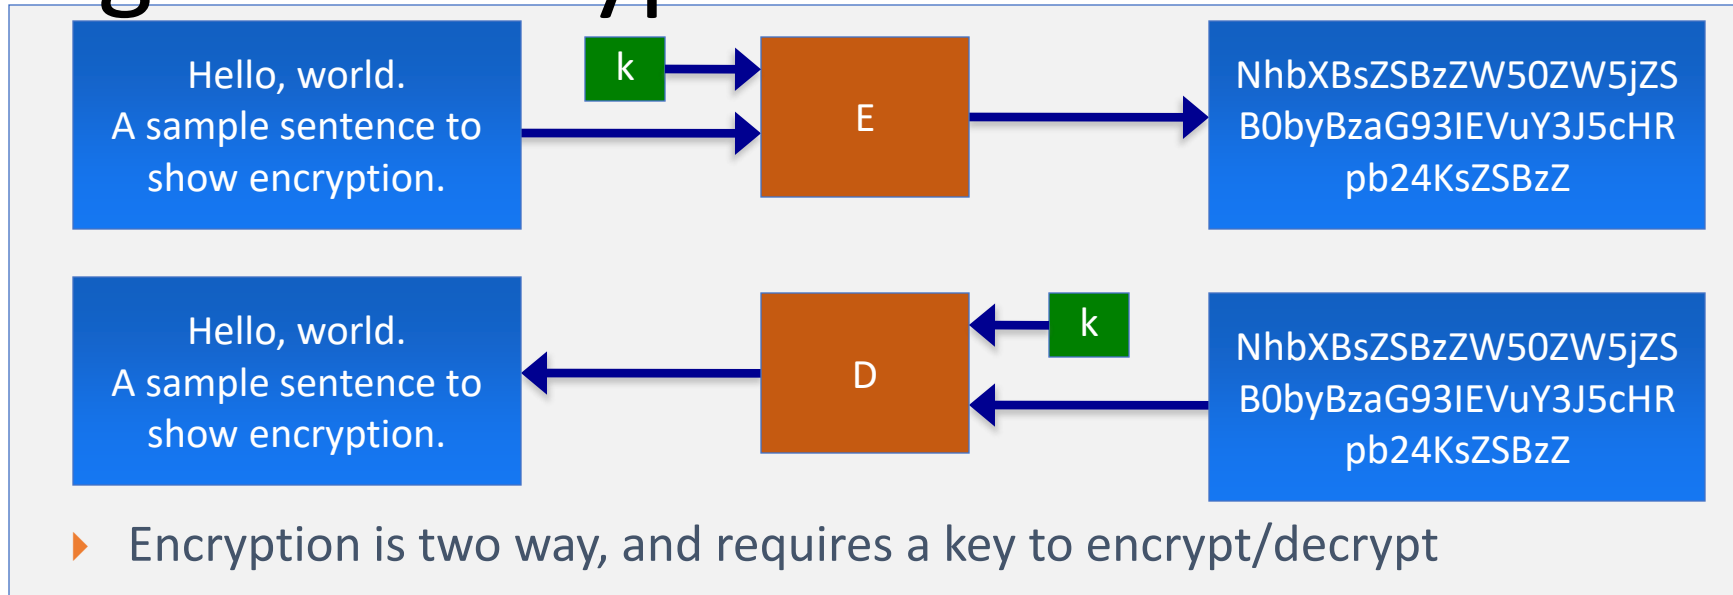

condenses arbitrary message to fixed size
$$h = H(M)$$

Chewing functions

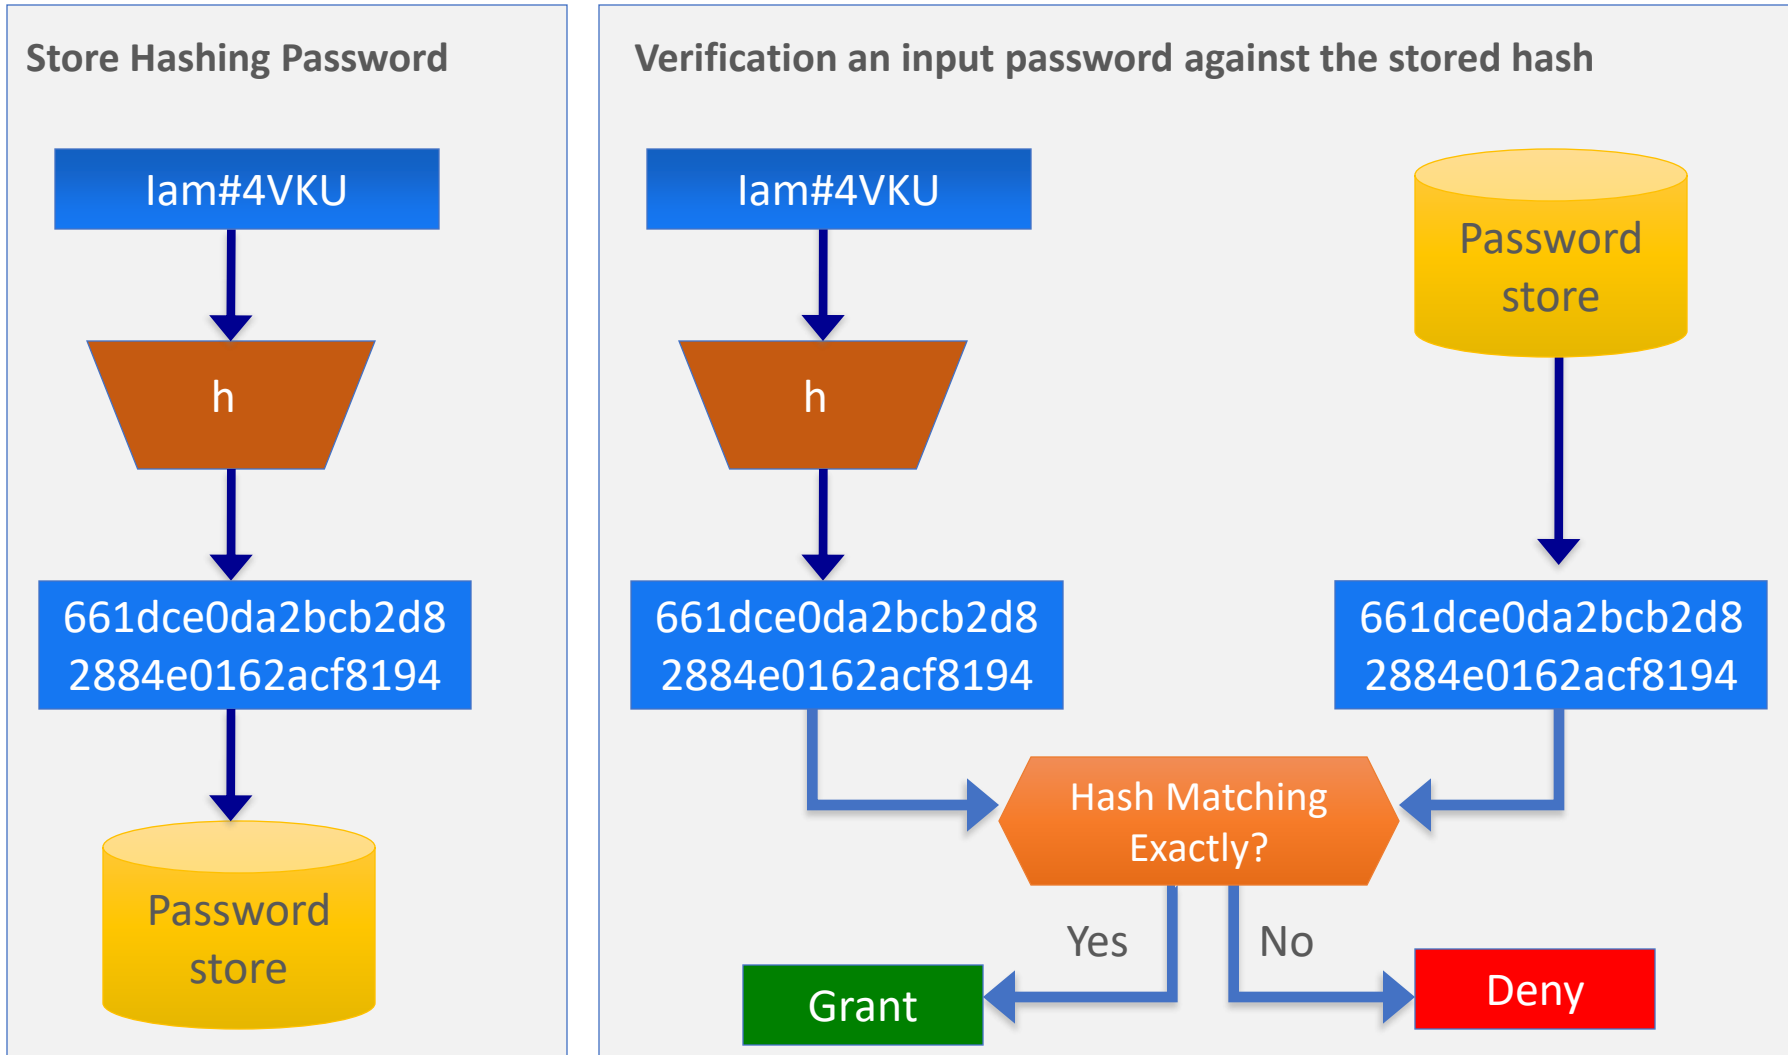

- ▶ Hashing function as “chewing” or “digest” function

Hashing V.S. Encryption

Password Verification

Hash Function Properties

- Arbitrary-length message to fixed-length digest
- Preimage resistant (**One-way property**)
- Second preimage resistant (**Weak collision resistant**)
- Collision resistant (**Strong collision resistance**)

Properties : Fixed length

- Arbitrary-length message to fixed-length digest

Demo: <https://www.fileformat.info/tool/hash.htm>

Collision resistance

You have only the cryptographic hash function at hand. It's hard to find two *different* inputs that *result in the same hash*.

Collision resistance

Pre-image resistance

You have the hash function and a hash. It's hard to find *a pre-image of that hash*.

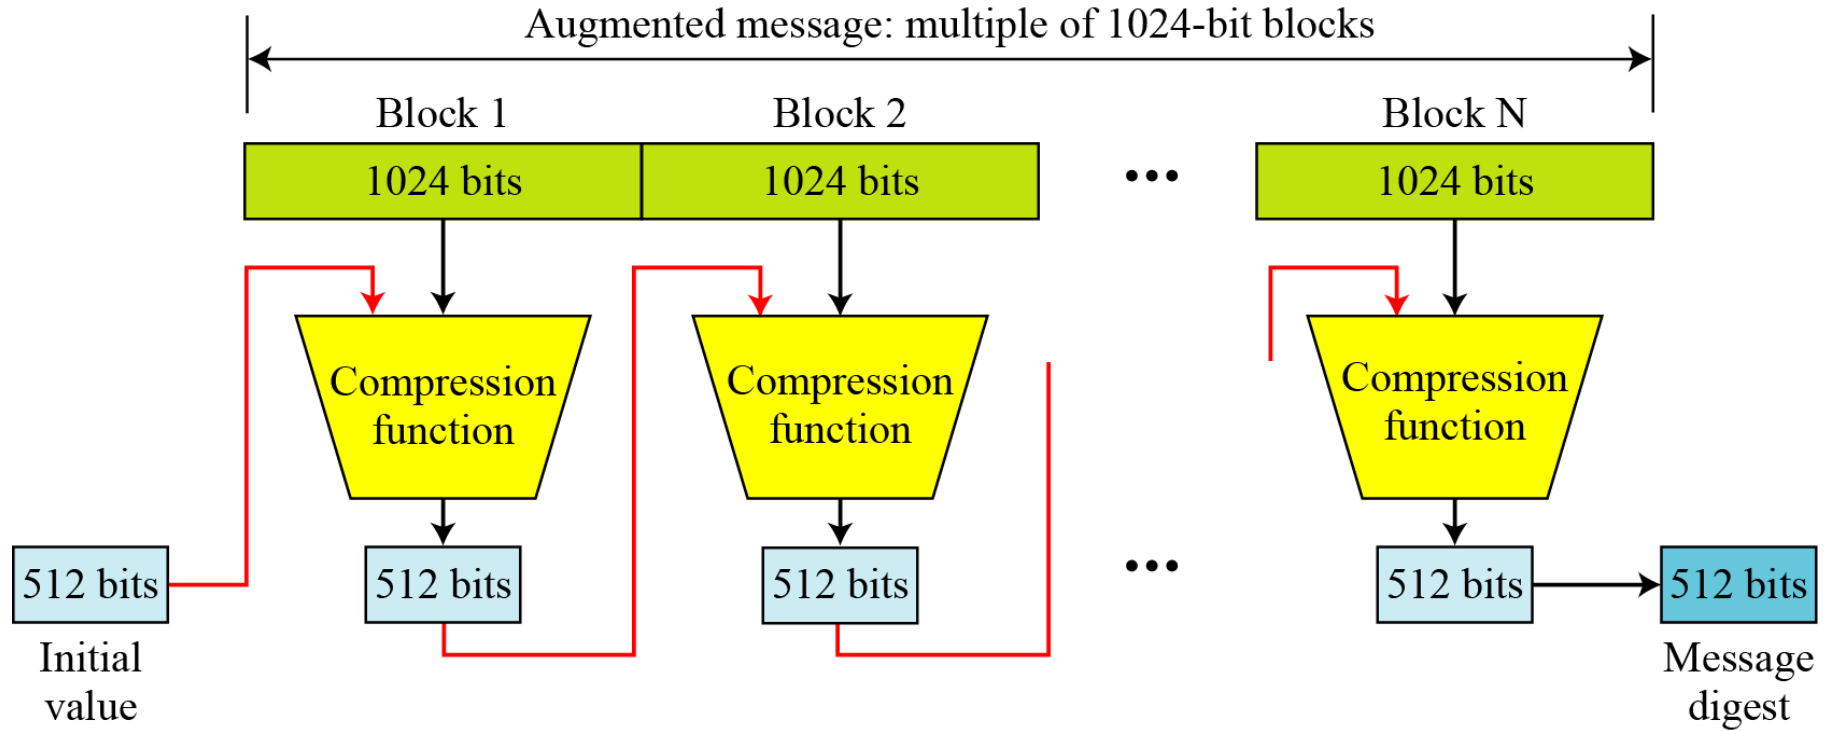

Second-pre-image resistance

You have the hash function and a pre-image (and thus the hash of that pre-image). It's hard to find *another pre-image with the same hash*.

Second-pre-image resistance

SHA-512 Overview

Padding and length field in SHA-512

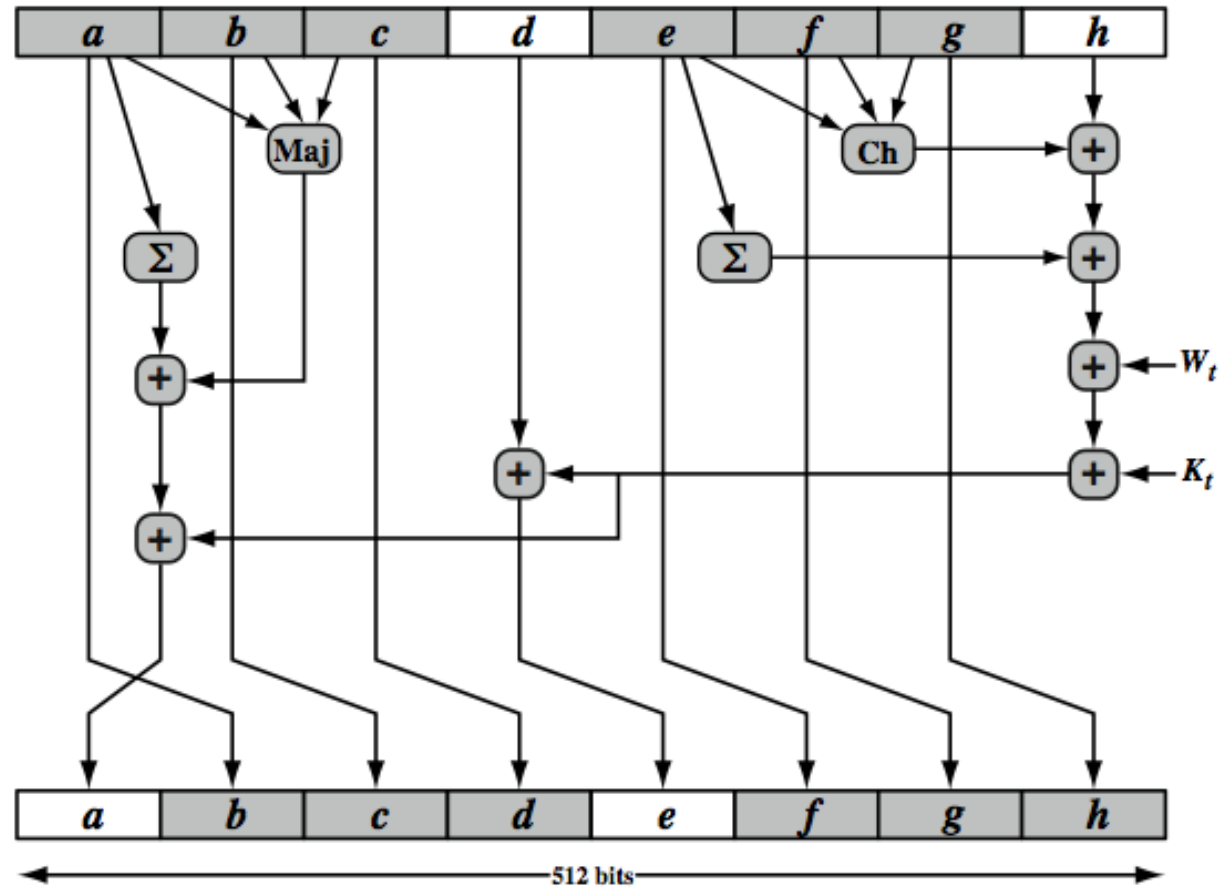

- **What is the number of padding bits if the length of the original message is 2590 bits?**
- We can calculate the number of padding bits as follows:

$$|P| = (-2590 - 128) \bmod 1024 = -2718 \bmod 1024 = 354$$

- The padding consists of one 1 followed by 353 0's.

SHA-512 Round Function

Some well-known hash functions

Name	Bits	Secure so far?	Used in Bitcoin?
SHA256	256	Yes	Yes
SHA512	512	Yes	Yes, in some wallets
RIPEMD160	160	Yes	Yes
SHA-1	160	No. A collision has been found.	No
MD5	128	No. Collisions can be trivially created. The algorithm is also vulnerable to pre-image attacks, but not trivially.	No

Patterns of Hashing Data

- Independent hashing
- Repeated hashing
- Combined hashing
- Sequential hashing
- Hierarchical hashing

Types of Hashing

- Independent hashing

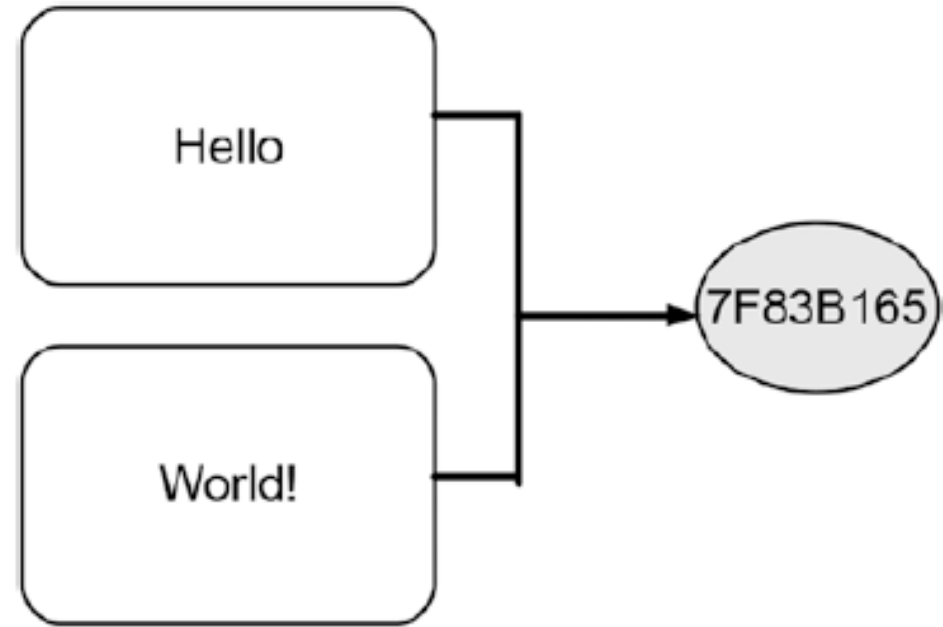

- Repeated hashing

Types of Hashing

- Combined hashing
- Sequential hashing

Types of Hashing

- Hierarchical hashing

Hash Pointer

- A **Cryptographic Hash Pointer** (Often called Hash Reference) is a pointer to a location where
 - Some information is stored
 - Hash of the information is stored
- With the hash pointer, we can
 - Retrieve the information
 - Check that the information has not been modified (by computing the message digest and then matching the digest with the stored hash value)

Hash Pointer

Tamper Detection using Hash Pointer

Puzzle Friendly

- Say M is chosen from a widely spread distribution; it is computationally difficult to compute k , such that $Z = H(M||k)$, where M and Z are known a priori.
- **A Search Puzzle** (Used in Bitcoin Mining)
 - M and Z are given, k is the search solution
 - Note: It might be not exactly a particular value Z , but some properties that Z satisfies, i.e., Z could be a set of possible values
- Puzzle friendly property implies that random searching is the best strategy to solve the above puzzle

Making Tampering a Hash Chain Computationally Challenging

<http://www.blockchain-basics.com/HashFunctions.html>

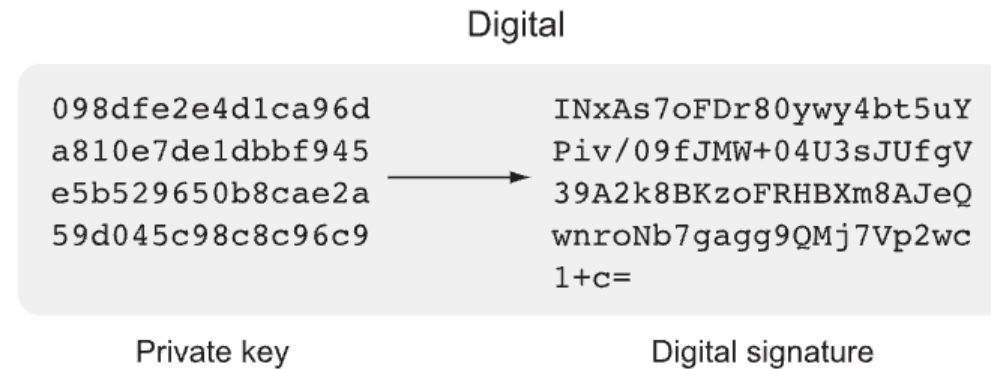

Nonces for Solving a Hash Puzzle

Nonce	Text to Be Hashed	Output
0	Hello World! 0	4EE4B774
1	Hello World! 1	3345B9A3
2	Hello World! 2	72040842
3	Hello World! 3	02307D5F
...		
613	Hello World! 613	E861901E
614	Hello World! 614	00068A3C
615	Hello World! 615	5EB7483F

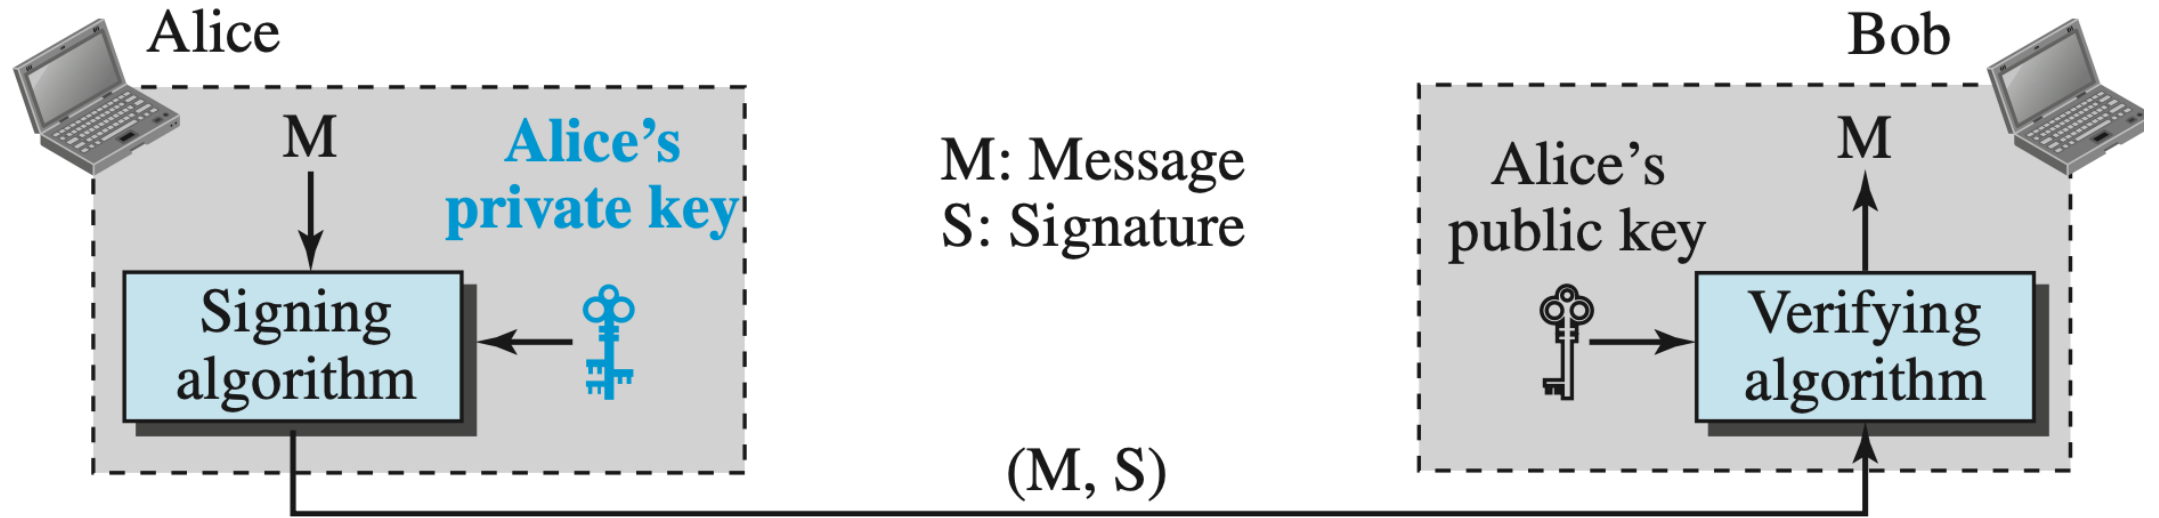

Detect Tampering from Hash Pointers - Hashchain

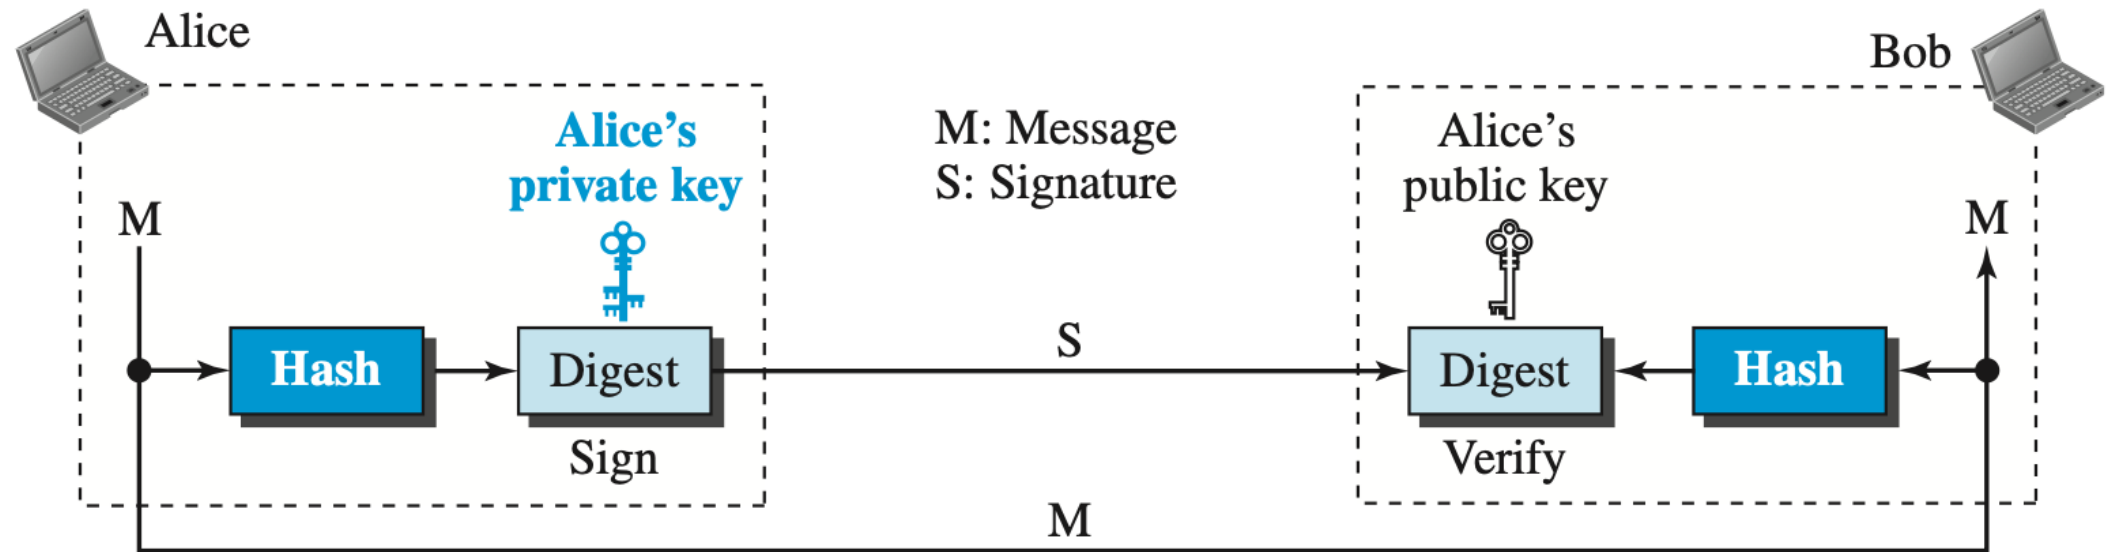

Digital Signatures

Digital Signature

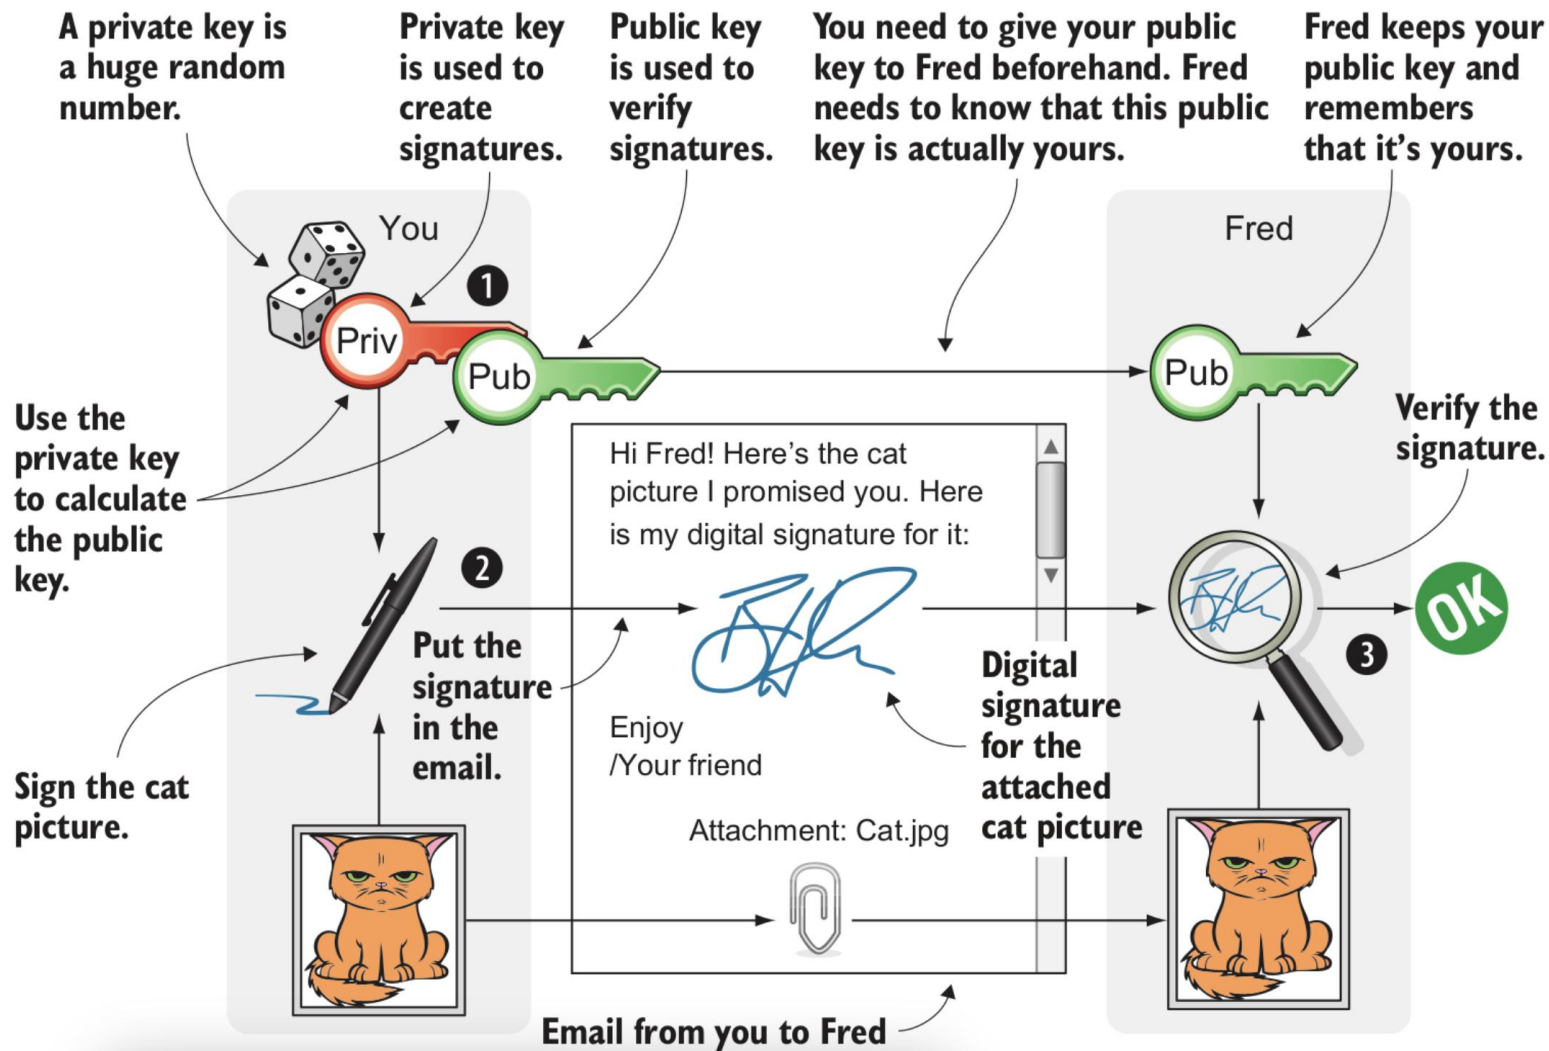

Digital Signature

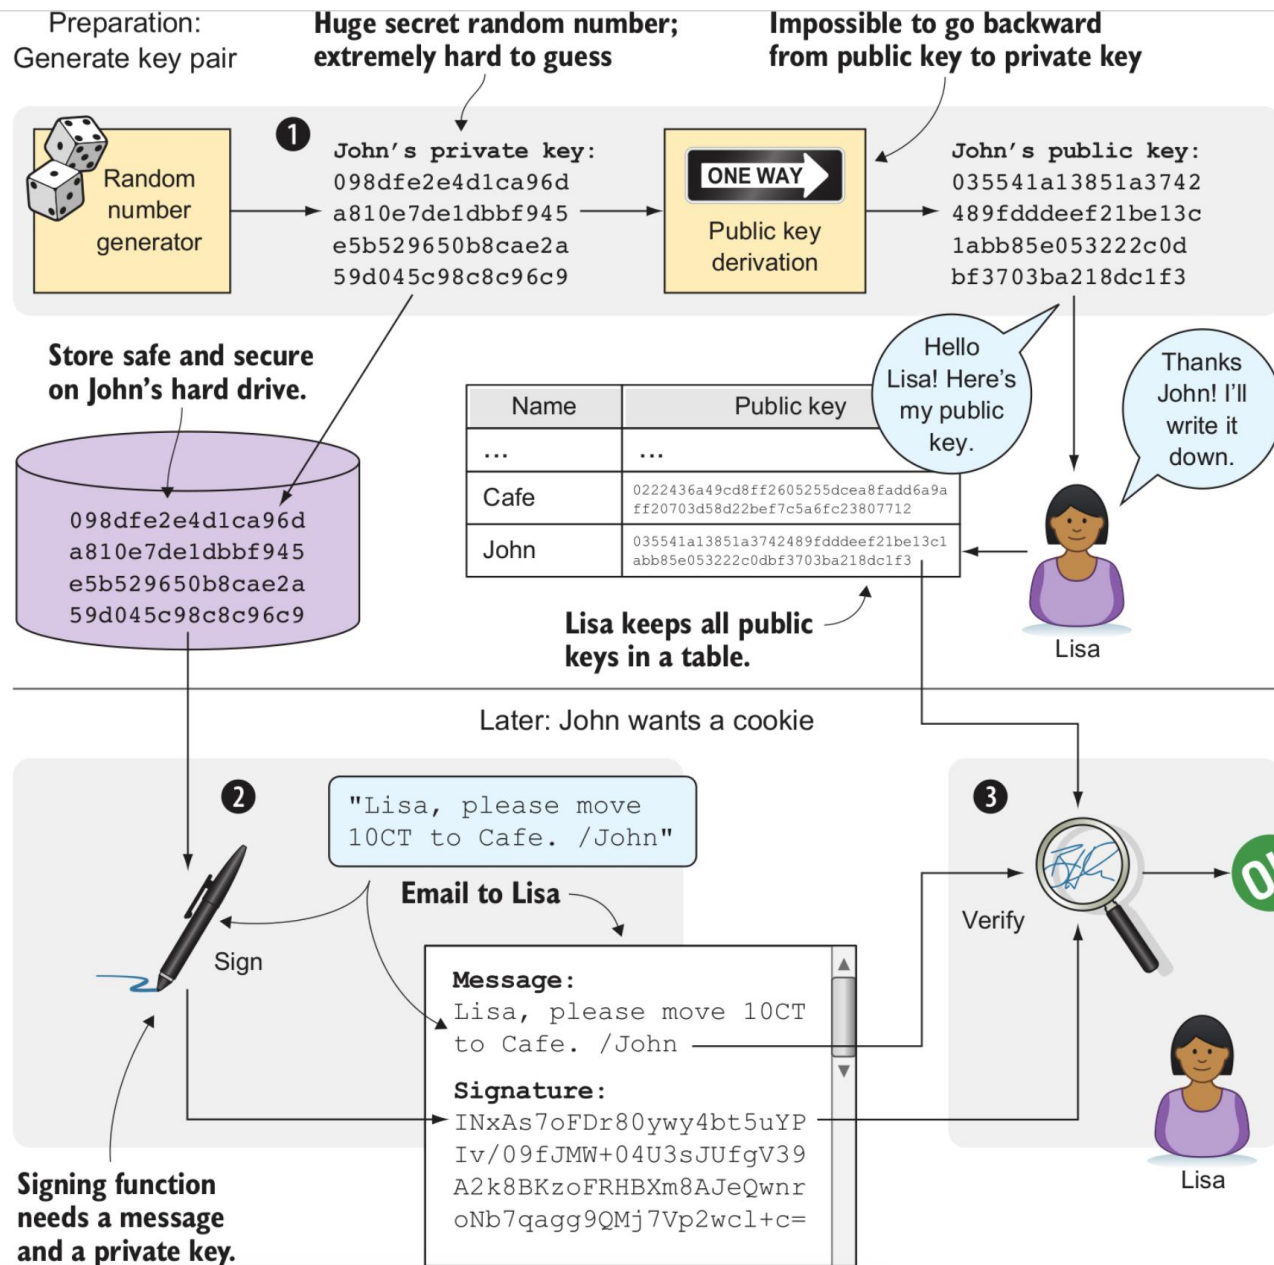

- A digital signature needs a public-key system. The signer signs with her private key; the verifier verifies with the signer's public key.
- A cryptosystem uses the public and private keys of the receiver; a digital signature uses the private and public keys of the sender.

Digital Signatures

Digital Signatures

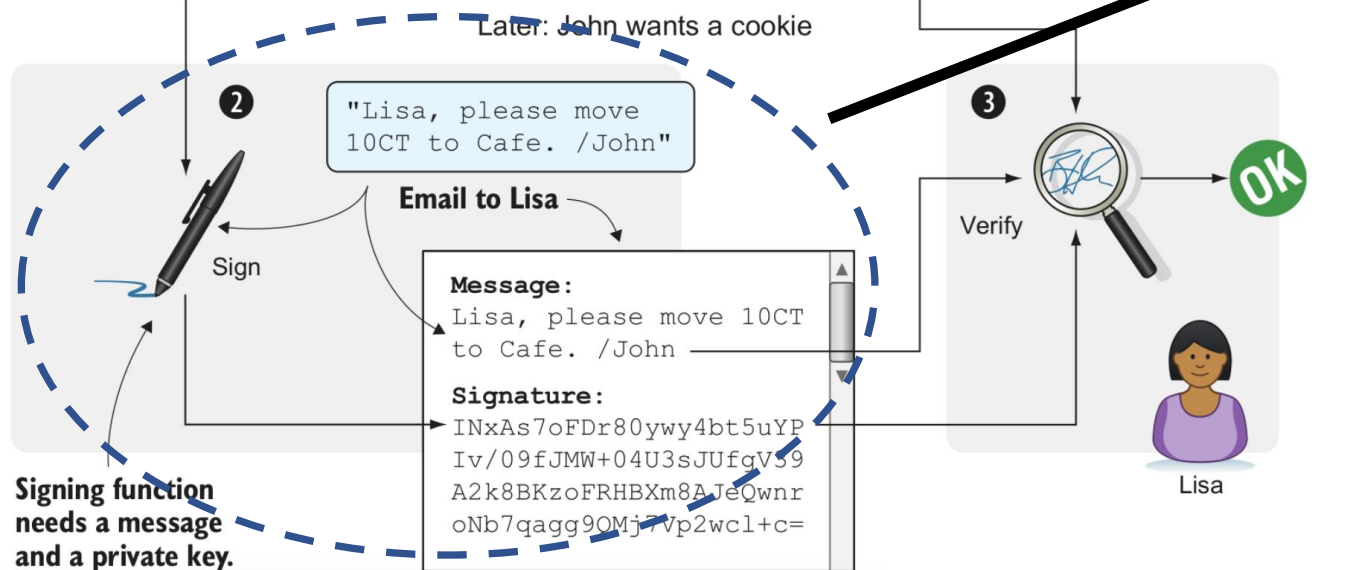

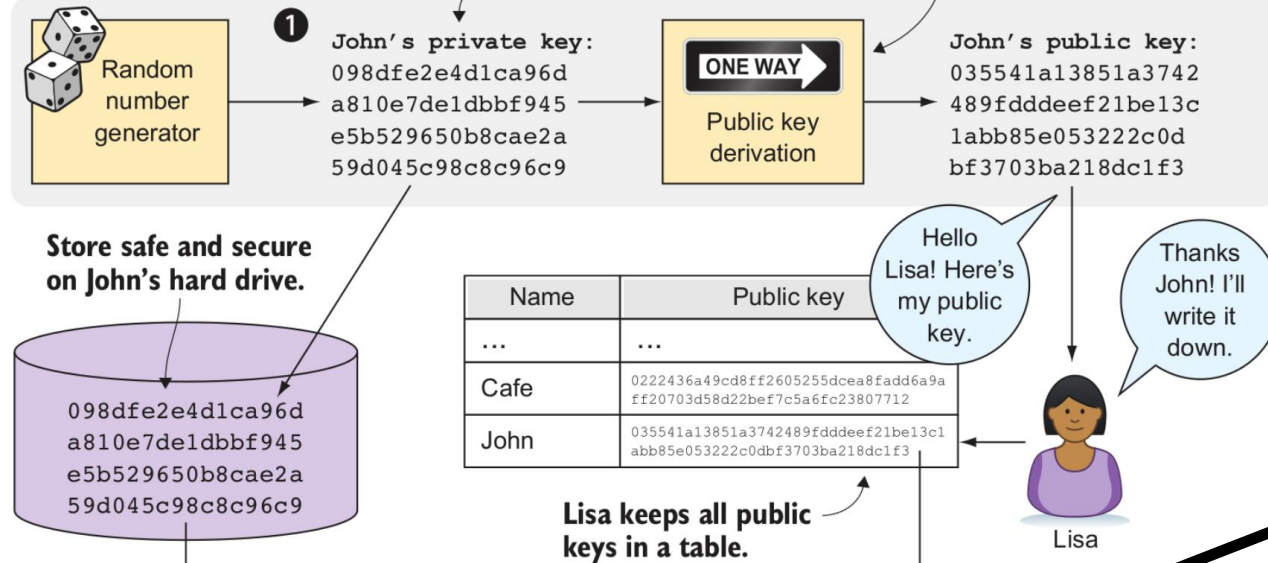

Digital Signatures

Preparation:
Generate key pair

**Huge secret random number;
extremely hard to guess**

**Impossible to go backward
from public key to private key**

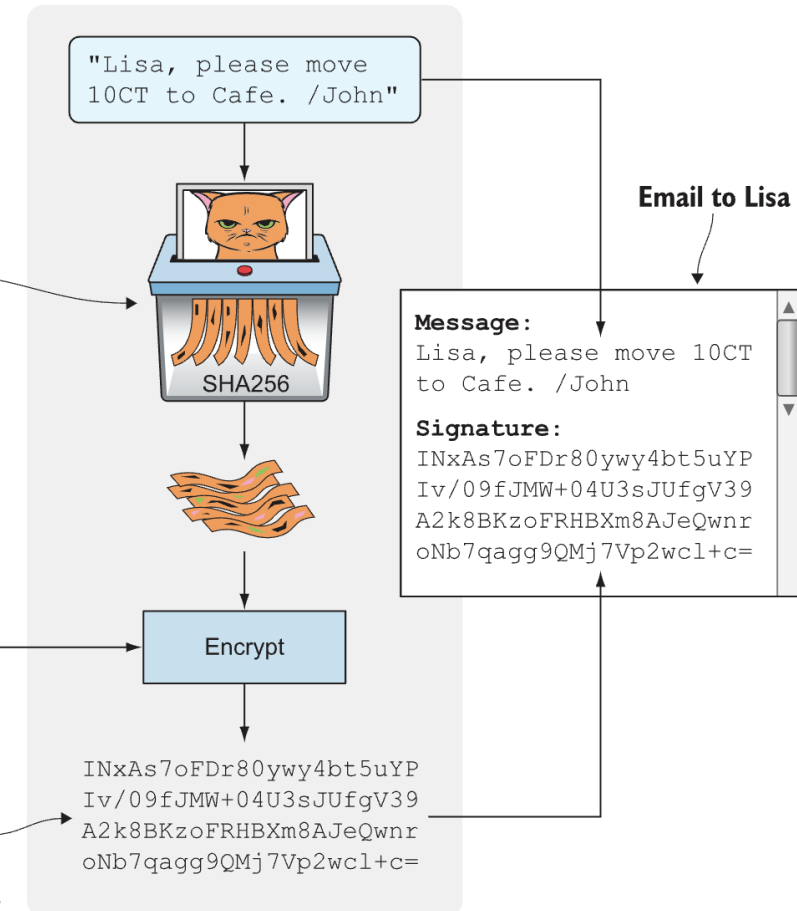

**Keeps the signature
short no matter the
length of the message**

**John reads this from
his hard drive.**

John's private key:
098dfe2e4d1ca96d
a810e7de1dbbf945
e5b529650b8cae2a
59d045c98c8c96c9

**Only John could have
created this signature.
He's the only one with
access to his private key.**

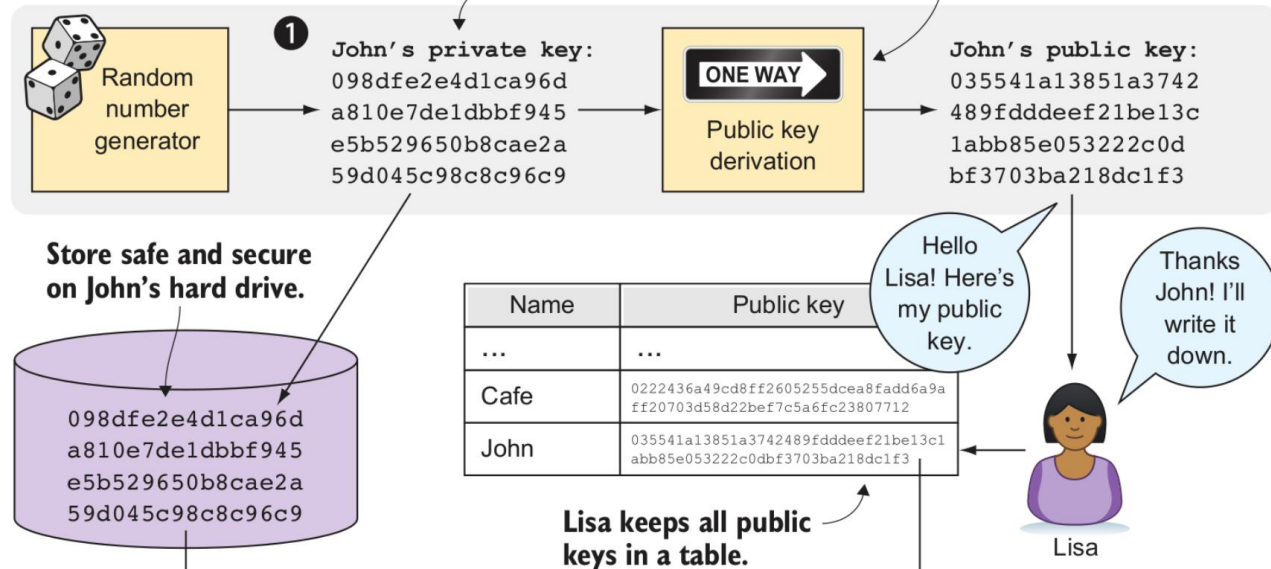

Digital Signatures

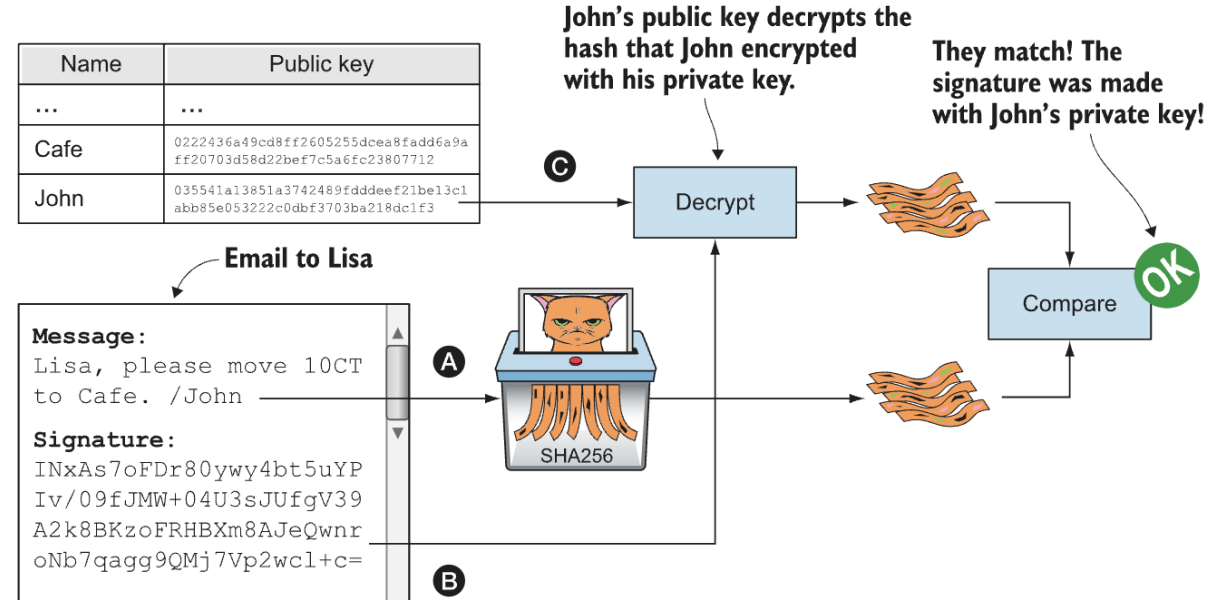

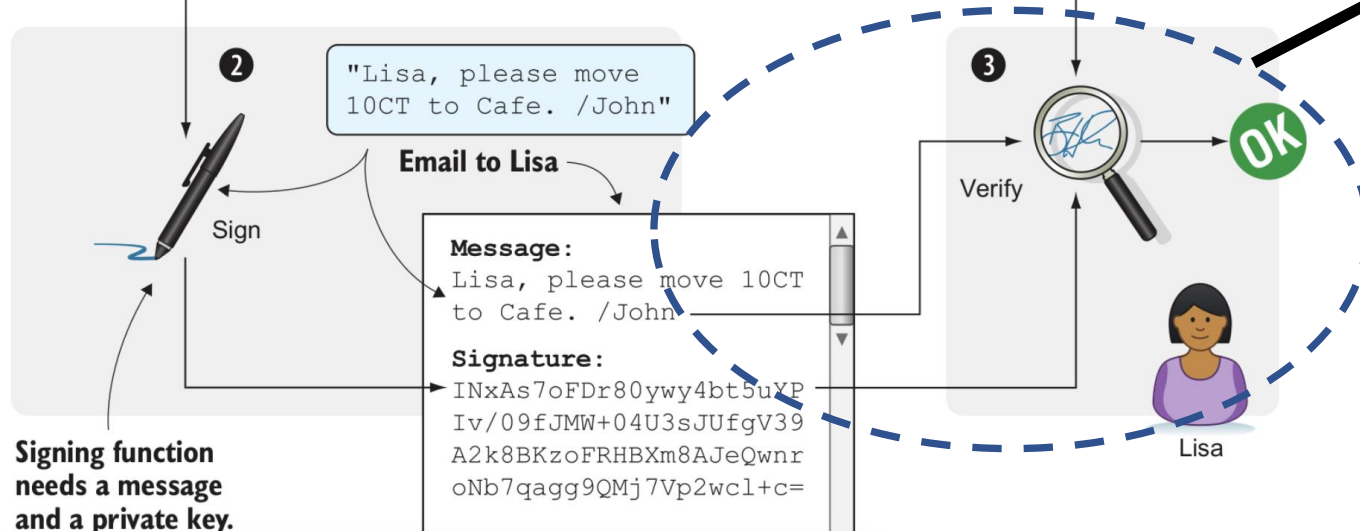

Preparation:
Generate key pair

Huge secret random number;
extremely hard to guess

Impossible to go backward
from public key to private key

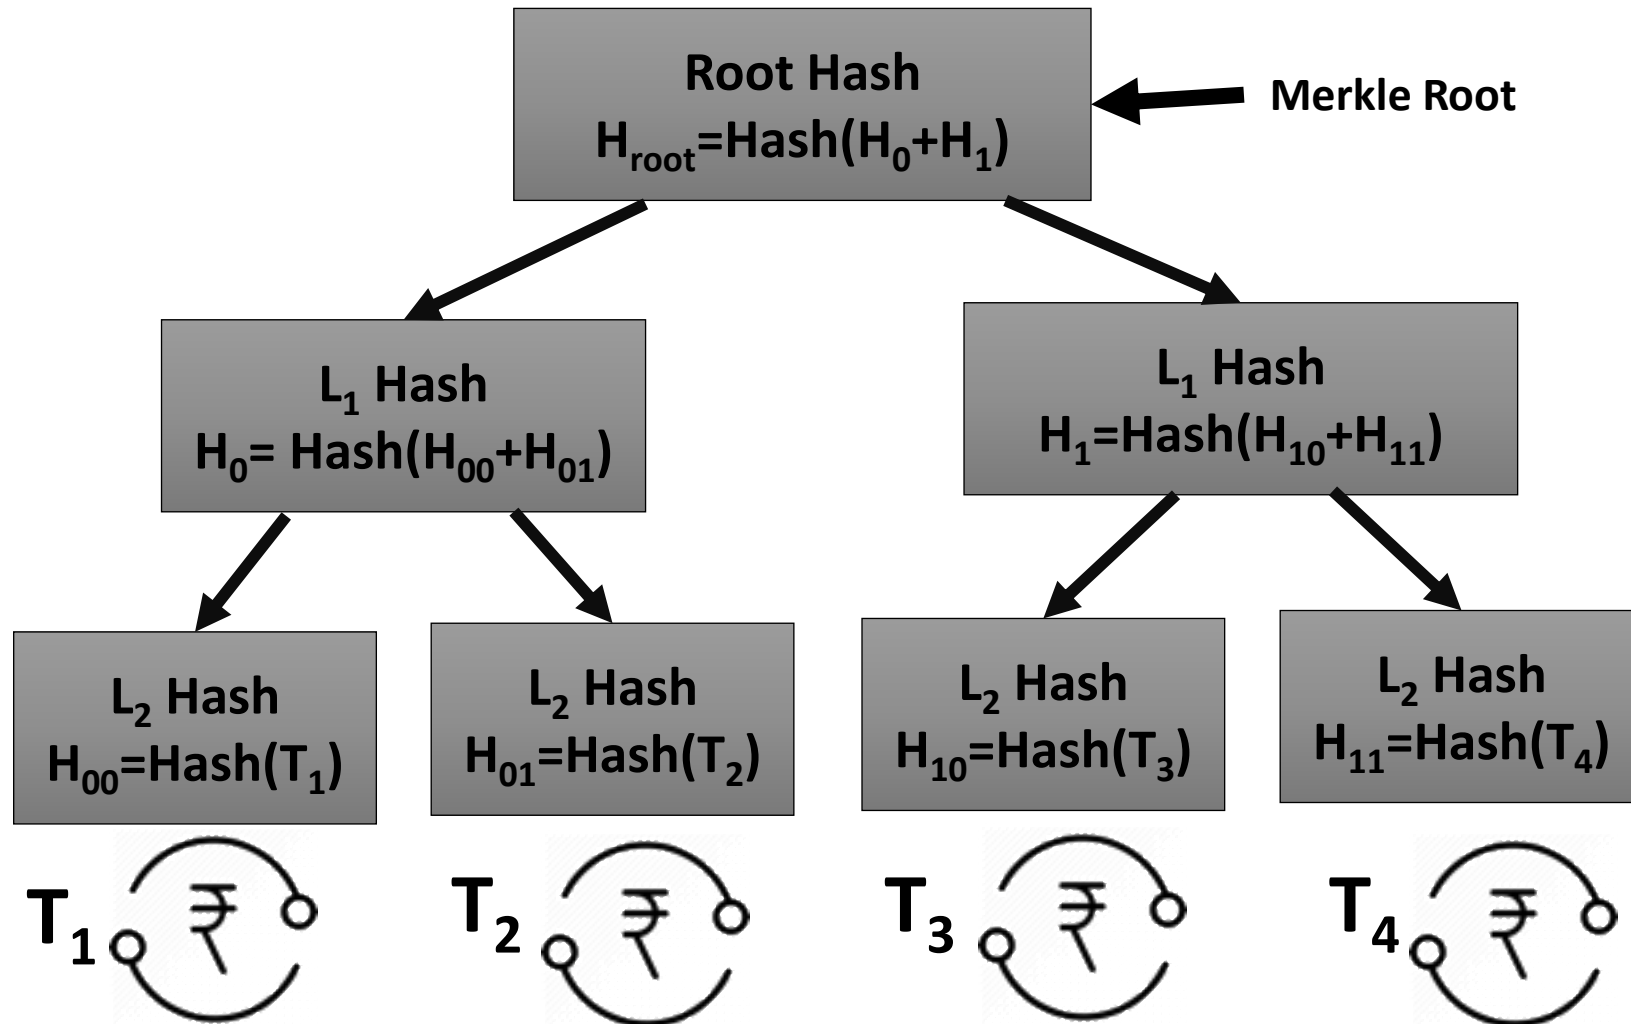

Later: John wants a cookie
